Ryng

New

The universal device for production monitoring

An extremely simple system to measure productivity and efficiency of the feeding line.

Benefits:

- Monitor of the material consumption in real time
- Control of the production batches
- Statistics of the production volumes
- Applicable with any loader device
- Remote control via WinFactory connection

In order to have an instant and all, to be able to have information prompt action on the machine's "Ryng". operating parameters and, above

precise measurement of the on the machine's effective proquantity of material transferred ductivity, Piovan has designed from the container to the hop- and manufactured a special graviper, allowing operators to take metric weighing system, called Ryng is structured as a component that is inserted between the loading container and the storage hopper with a high-precision weighing device placed inside it.

The system uses proprietary software, set according to specific algorithms which "filter" and "interpret" the data it gathers and consequently indicate the actual quantity of transferred material. Ryng actually measures the quantity of material that the container loads into the hopper, providing information directly from the field and therefore allow-

ing real-time comparisons to be made at any time between the machine's expected production and its actual production.

In addition, the software is programmed to exclude or reduce to a minimum any measurement fluctuations that may be caused by the inevitable vibrations felt throughout the feeder system due to the machine's normal operation.

So, the system achieves high precision measurements (with a maximum error rate of less than 1%).
